

Basic Life Support Course Summary

Our Basic Life Support session is aimed towards providing caregivers with a working, tested knowledge of the processes involved in assessing an incident and providing appropriate emergency treatment on-site.

As part of the course delegates will cover and be able to:

- Demonstrate how to approach an incident
- Demonstrate how to check for consciousness
- Demonstrate how to place a person in the recovery position
- Demonstrate how to perform C.P.R.
- Demonstrate how to assist a person who has a partially blocked airway
- Demonstrate how to assist a person who has a completely blocked airway

Learners are encouraged to share their existing knowledge of Basic Life Support with the group.

Learners will be shown how to approach an incident and how to demonstrate basic life support to include: checking levels of consciousness and how to place a person in the recovery position.

Learners will be shown how to perform C.P.R. using a manikin then moving onto how to assist a person who has a partially blocked airway and again how to assist a person who has a completely blocked airway using the manikin.

All learners will then individually demonstrate what they have learned, this will be assessed and an observation record will be completed by the tutor.
